3780. ON THE EFFECT OF SEROTONIN (5-HYDROXYTRYPTAMINE) ON THE
HYPOTENSIVE ACTIVITY OF HISTAMINE - Trzebski A. Lab. of
Human Physiol., Sch. of Med., Warsaw - BULL. ACAD. POL. SCI. Cl. 2
1958, 6/10 (441-444) Graphs 1

The effect of 5-HT (30-60 $\mu\text{g./kg.}$) on the hypotensive activity of histamine (0.25-1.0 $\mu\text{g./kg.}$) was studied on 20 bilaterally vagotomized cats in chloralose anaesthesia. Blood pressure was registered in the common carotid artery. the compounds injected were introduced into the femoral vein or inferior vena cava (with the aid of a catheter inserted through the femoral vein) or 5-HT was introduced alternately into the left ventricle and the aorta with the aid of 2 catheters. When 5-HT produced hypotensive effects, a 5-HT-histamine mixture in ratios ranging between 40:1 and 300:1 produced considerably smaller effects than histamine alone. I.v. administration of histamine during slow infusion of 5-HT caused the hypotensive effects of the former to become substantially reduced or altogether abolished. The phenomena could be observed also in decapitated cats with destroyed spinal cord, after pharmacological blocking of transmission in vegetative ganglia or in bilaterally adrenalectomized animals. The described effects occur irrespective of whether the substance is introduced into the left ventricle or into the descending aorta.

Bile salts introduced into the arteriole which supplies the loop of the small intestine in cats, isolated as to circulation and innervated, induce a reflex increase of pressure up to 50 mm./Hg as well as the deepening and acceleration of respiratory movements. The threshold doses for Na glycocholate and taurocholate amount to about 0.5-1.0 ml. 1/20 M-1/40 M of the solution. Na dehydrocholate is active in a 10-fold dose. The sectioning of the nerve bundle which supplies the examined loop of the intestine, or the administration of procaine to the isolated circulation within the loop, annihilates the entire effect. Similar changes were shown by applying bile salts to the arteriole of the intestinal loop not isolated as to circulation. Total bile shows a considerably weaker influence. An assumption is put forward on the significance of the reflex in question for the preservation of a normal level of arterial tension and a normal blood supply to the intestines during digestion and absorption.

Title : The Effect of the Salts of the Bile Acids on the Angioreceptors of the Small Intestine

Orig Pub : Polski tygod. lekar., 1956, 11, No 2, 948-950

Abstract : Salts of the bile acids injected into the arterioles supplying an isolated loop of the small intestine of a cat produced a reflex rise in blood pressure of up to 50 mm Hg and an increase in the depth and frequency of respiratory movements. The threshold doses for the Sodium salts of glycocholic and taurocholic acids were ~ 0.5--1.0 ml of a 0.5--0.25 M solution. Sodium dihydrocholate exerted an effect in approximately a ten-fold dose. Sectioning the nerve fibers innervating the intestinal loop, or injecting novocaine into the isolated circulation of the loop inhibited the effect. Similar changes were noted when the salts were injected into the

The method of investigation of chemoreflexes from angioreceptors without circulatory isolations is described. The investigated compounds were introduced by a thin catheter at various levels of aorta, to the iliac arteries, to the portal vein and at the level of the coronary arteries. Procaine abolishes the reflex effects and azamethonium removes the pressor component of the reflex, the hyperpnoea being left. An increase of the magnitude of reflex to KCl in particular the respiratory effect, is found as the outlet of the catheter is moved to the lower segments of the abdominal aorta and near the ramification. The reflex effect from this region does not depend upon the glomus coccygeum and iliac arteries. Bilateral removal of the adrenals does not prevent the pressor reflex reactions but it eliminates increases of the pressure due to a direct stimulation of adrenal medulla by KCl and ACh. Dihydroergotamine abolishes but does not invert the pressor reflex reaction, ACh and ATP do not show a distinct reflex action by the catheterization method. ATP given through a catheter at the level of the coronary arteries produces the Bezold-Jarisch reflex. Bilateral vagotomy always prevents the occurrence of this reflex but it does not abolish the decrease of pressure following ATP, which lasts even longer. The pressor reflexes from the region of the portal vein and the hepatic circulation to KCl and KCN are very indistinct.

"O działaniu na układ krążenia histaminy wprowadzonej metodą cewnikowa-
nia serca i aorty. Circulatory effects of histamine introduced
by catheterization into the heart and aorta ACTA PHYSIOL.
POL. 1956, 7/4 (421-433) Illus. 6

In 15 dogs weighing 8-16 kg., under i.v. thiopental anaesthesia, histamine phos-
phate (5-400 µg. in 1 ml. solution) was introduced into the heart and various seg-
ments of the aorta through flexible catheters previously filled with heparin. The
following conclusions are presented: (1) The latent period of the poathistamine
decrease of blood pressure regardless of the dose introduced into the aorta lasts
3-4 sec.; 12-18 sec. after i.v. introduction and 8-12 sec. after introduction into
the right ventricle. (2) A non-homogeneous picture of changes is observed after
introduction of histamine into the left ventricle. Type I - the extent and the latent
period do not differ from its introduction into the aorta. Type II - changes last

3933

CONT.

fyng to the appearance of heart paralysis in diastole, increase of systolo-diastolic amplitude and slowing of the heart rate develop. Type III occurs irregularly and only with larger doses. (3) After introduction of histamine into the coronary circulation, negative inotropic and chromotropic effects are observed on analysis of the pressure curve. (4) The post-histamine character of the drop in the pressure curve changes from monophasic to biphasic if histamine has been introduced into the aorta just below the coeliac artery.

5361. TRZEBSKI A. Dept. of Human Physiol., Sch. of Med., Warsaw. • The effect of cholic salts on the adrenal medulla and the adrenergic system BULL. ACAD. POLON. SCI. 1957, 5/1 (25-29) Graphs 7

In 34 cats anaesthetized by i.v. urethan administration a typical effect was induced by bile salts introduced into the adrenal circulation. When the bile salts were introduced into the cerebral circulation there was a contraction of splanchnic vessels and a rise in blood pressure which persisted after bilateral adrenalectomy. However, both were considerably depressed after both splanchnic nerves had been severed. The bile salts also stimulated the angioreceptors of a loop of the small intestine, causing a rise in blood pressure and rate of respiration. Adrenaline and noradrenaline diminished or suppressed the hypotensive effect of bile salts administered i.v.

(School Med., Warsaw). *Bull. acad. polon. sci. Classe II.*
4. 151-4(1950) - When histamine was introduced into the
common or internal carotid artery of dogs, after denervation
of the adjoining receptor area, a double response in blood
pressure consisting of hypertensive and hypotensive phases
was obtained. Barbitol narcosis abolished partly or com-
pletely the hypertensive phase. The hypertensive phase
was regular and clearly apparent in animals which received
d-tubocurarine instead of narcotics. When histamine was
introduced into the cerebral circulation, the intensity and
the duration of the pressure drop in the phase of peripheral
action were less marked than the respective peripheral
effect after intravenous injection. Benadryl introduced
intravenously abolished the hypertensive effect. Dihydro-
ergotamine injected intravenously abolished the hyperten-
sive effect of histamine and prolonged the hypotensive
phase. M. W. Smith

Practical experiments with leadless and boron-free glazes as applied to the production of porcelain. CZESLAW TRZKPIREK-ZYNAKI. *Szkl i Ceram*, 2 [4] 87 (1951). T gives empirical formulas and batch compositions for various glazes based on W. Steger's findings. T concludes that leadless and boron free glazes can be represented by a formula varying between the following limits: KNaO 0.20 to 0.30, CaO 0.25 to 0.35, MgO 0.08 to 0.16, BaO 0.15 to 0.30, ZnO 0.4 to 0.12, Al_2O_3 0.15 to 0.25, and SiO_2 1.5 to 2.3. Some of the findings were used successfully in mass production. Faultless results were obtained when the glazes were fired between Seger cones 1a and 6a. A D I

Orig Pub : Prace Morsk. inst. ryback. Gdyni, 1955, 8, 335-374

Abstract : A new procedure has been worked out for the production of leather from fish skins (of cod, flounder, shark). Methods of primary treatment and sorting are described. A detailed account is given of the conditions of soaking, liming, bating, tanning (single chrome, vegetable and vegetable-syn-tan), and other operations.

AUTHORS: Trzhetsinskiy, A.V., Engineer,
Shneydman, A.Ye., Candidate of Technical Sciences

TITLE: Determination of the frequencies of bending
vibrations of blades and the critical speeds of
multi-supported rotors

PERIODICAL: Energomashinostroyeniye, no.9, 1962, 8-16

TEXT: There is a need for adaptation to computers of methods of
calculating the free oscillation of twisted blades of the later
stages of large steam and gas turbines and the critical
frequencies of coupled rotor shafts. The authors develop a
mathematical solution for determining natural frequencies of
bending oscillations of straight twisted rods and applies it to
blades and flexibly coupled rotors. The bending moments about
some fixed (x,y,z) axes are

$$\left. \begin{aligned} M_x &= D' \sin 2\varphi \frac{d^2 x}{dz^2} - (S' + D' \cos 2\varphi) \frac{d^2 y}{dz^2}; \\ M_y &= -D' \sin 2\varphi \frac{d^2 y}{dz^2} + (S' - D' \cos 2\varphi) \frac{d^2 x}{dz^2}. \end{aligned} \right\} \quad (1)$$

Card 1/4

S/114/62/000/009/001/003

Determination of the frequencies ... E200/E484

$$\left. \begin{aligned} \frac{d^2x}{dz^2} &= \frac{1}{E(J_x J_y - J_{xy}^2)} (J_x M_y + J_{xy} M_x); \\ \frac{d^2y}{dz^2} &= -\frac{1}{E(J_x J_y - J_{xy}^2)} (J_y M_x + J_{xy} M_y). \end{aligned} \right\} \quad (7)$$

substituting

$$\left. \begin{aligned} M_y &= M_{y0} + \frac{M_{y1} - M_{y0}}{\Lambda z_1} z; \\ M_x &= M_{x0} + \frac{M_{x1} - M_{x0}}{\Lambda z_1} z. \end{aligned} \right\} \quad (8)$$

from the above boundary equations, by integrating twice, we get expressions for the total and differential deflection along the rod. From these formulas, the total deflection can be found. The procedure is repeated for subsequent points. The total and differential deflections at any point can be obtained from the following equations

Card 3/4

Determination of the frequencies ...

S/114/62/000/009/001/003
E200/E484

$$\left. \begin{aligned} Q_{xn} &= a_{11}Q_{x0} + a_{12}Q_{y0} + a_{13}M_{x0} + \dots + a_{1n}y_0 \\ Q_{yn} &= a_{21}Q_{x0} + a_{22}Q_{y0} + a_{23}M_{x0} + \dots + a_{2n}y_0 \\ &\vdots \\ y_n &= a_{n1}Q_{x0} + a_{n2}Q_{y0} + a_{n3}M_{x0} + \dots + a_{nn}y_0 \end{aligned} \right\} \quad (23)$$

where a_{ik} - numerical coefficients which can be determined from tables which are included in the article. If a rod has more than two supports then it is necessary to know the boundary conditions at the ends of every span. Knowledge of forces at the ends enables us to find p by successive approximations. Since there may be more than one value of p it is advisable to plot a graph of p against a known boundary force. Two worked numerical examples are given: a blade subjected to twisting moments and a compound rotor. Calculations of critical speeds of rotors can be made very quickly on a Strela-3 or Ural-1 computer. There are 4 figures and 6 tables.

AUTHOR: Shneydman, A. Ye. (Candidate of technical sciences);
Trzhetsinskiy, A. V. (Engineer); Lupilov, L. I. (Engineer)

TITLE: Determining the cantilever-vibration frequency of rotating twisted blades

SOURCE: Energomashinostroyeniye, no. 3, 1964, 8-12

TOPIC TAGS: turbine, turbine blade, twisted blade, twisted blade vibration,
cantilever vibration, twisted blade vibration frequency, blade cantilever vibration

ABSTRACT: The frequency of free vibration of stationary twisted blades was found earlier by the residue method by these authors (Energomashinostroyeniye, no. 9, 1962). In the present article, the method is extended over the case of rotating blades. By regarding the blade as an elastic weightless bar carrying a series of point masses and by considering the vibration component forces, design formulas have been developed and design coefficients estimated (given in two

Card 1/2

ACCESSION NR: AP4023731

tables). The design procedure lends itself easily to computer programing. An example was calculated on the "Ural-4" computer. The vibration frequencies were estimated as well as experimentally determined for 780-mm and 1,050-mm-long twisted blades, for both stationary and rotating states. The rotation tests "were conducted in a steel vacuum chamber"; the rotor was driven by a variable-speed d-c motor. "Vibrations were set up by a steam jet directed at the blades." The speed was varied within 0-3,300 rpm. Orig. art. has: 4 figures, 11 formulas, and 4 tables.

PLATE 1 BOOK EXPLANATION 807/1113

Automation of mechanical processes in technological industry: (Automation of mechanical processes in technological industry) Moscow, Nauka, 1979. 358 p. Extra slip inserted. 6,000 copies printed.

General Ed. I. M. Dubrovskiy, M.V. Sabashnikov, Candidate of Technical Sciences, Doctor, and Ye. V. Miller, Candidate of Technical Sciences, Doctor; Ed. of Publishing House V.I. Leytina and K.A. Gerasimov, Ed. O.Y. Ponomarev, Managing Ed. for Literature on Machine-Building Technology (Leningrad, Nauka) Ye. P. Babitskiy, Engineer.

PREFACE: This book is intended for technical personnel.

CONTENTS: The book deals with the automation of mechanical machine processes in small-lot production in technological industry. The use of hydraulic copying slide mechanisms is explained, and practical experience in the introduction of such slide mechanisms into existing plants is described. The improvement of such slide mechanisms, the technical and economic effects resulting from their usage, and methods of designing water forms are discussed. For designs of hydraulic slide mechanisms are described. Emphasis is laid upon problems of program control, especially for the simplest control systems, and a modern, the original program control system, is described.

Appendix: The book is intended for the group of technical personnel in technological industry who are engaged in the design and construction of hydraulic copying slide mechanisms and in the control of such mechanisms. It is recommended to be read by all personnel in the group of technical personnel in technological industry who are engaged in the design and construction of hydraulic copying slide mechanisms and in the control of such mechanisms.

Title : Supplement to the Measurement of the Coefficient of Reflection of Long Waves (Measurement of Frequency of Polarization Fading).

Orig Pub : Geofys. sbor. 1956, Praha, 1957, No 36-60, 719-725

Abstract : Description of a device for the measurement of the speed of polarization fading of long radio waves. All the equipment are adapted for an ordinary laboratory use. The device is used for measuring the speed of fading of radio waves in the ionosphere. The circuit, adapted for fading of the long radio waves of the frequency 1 to 10 MHz, is described. The current flowing through it has a polarity that depends on the polarity of the fading. This current, suitably amplified, controls the operation of a polarized relay, which fixes the change in the direction of the current, i.e., fixes each period of fading. The time constant of the operation of

TITLE: Annual variation of absorption in the ionosphere in the medium
 and long-wave regions

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 6, 1965, 1046-1051

TOPIC TAGS: ionospheric absorption, ionospheric radio wave

ABSTRACT: The authors compare the results of absorption measurements
 (atmospheric probe method) in the middle latitudes on equivalent fre-
 quencies of 125, 185, 730, and 1000 kc. A strong reduction is observed
 in the intensity of the winter anomaly as the frequency decreases. Mea-
 surements at a constant zenith angle χ show that the winter anomaly in-
 creases with altitude in the mesopause region. The absorption shown a
 minimum at all frequencies in the spring (April). It is shown that the
 annual behavior of absorption in the 150-500-ke range has two sharply
 defined maxima--one in the summer and one in the winter. A summer (May-
 -September) anomaly of increased absorption predominates in the lower

frequency region. Absorption anomalies are also nearly fully developed at solar zenith angles between 100 and 9.0°. Therefore if the relationship $\cos^n \chi$ is used to describe the diurnal variation in total absorption, the exponent n is underestimated. The authors discuss the significance of the observed annual variations of processes in the D layer of the ionospheric plasma with regard to the structure and dynamics of the mesosphere. Orig. art. has: 3 figures, 1 table, and 2 formulas. [14]
